# Applications and Workflows with Deep Secure Protection

1 The application or **workflow requires a business document** to be uploaded.

2 The document is used by the attacker to **deliver a malware attack.**

3 The document is presented to **Deep Secure Threat Removal as a Service using a cloud API.**

Extract → **Verify** → **Build**

4 **Deep Secure's Threat Removal platform** receives the document, **extracts** the valid business information, **verifies** it, discards the original, **builds** a wholly new file populated with the valid business information and hands it back to the application or workflow.

5 **The document is 100% risk-free**, fully editable, in the same file format as the original and the whole process happens in real-time.
