Web Document Download with Deep Secure Protection

DEEP SECURE
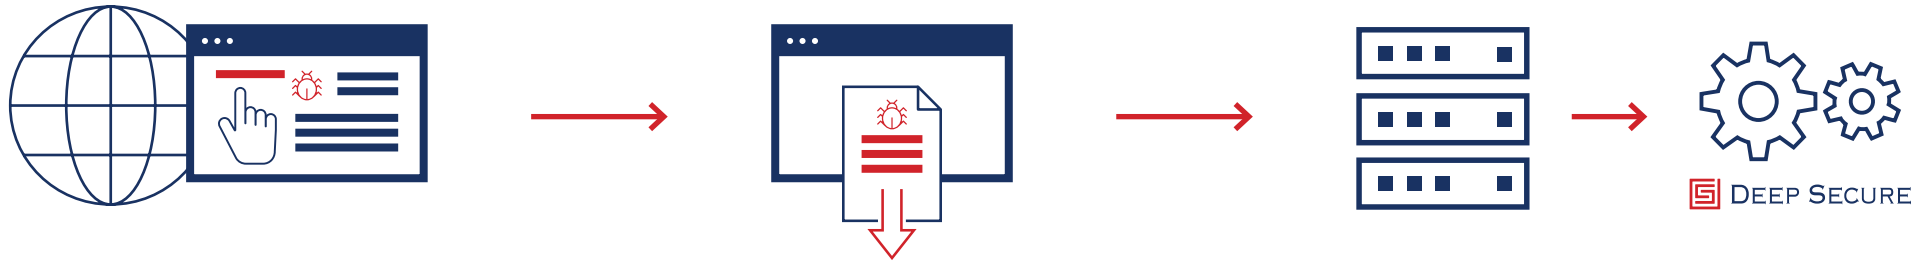

1 **Users access the Internet for business and personal use,** downloading images and documents from websites and by clicking on webmail links.

2 Attackers place malware onto a website and direct users to it via links in an email or from other websites. **The malware is designed to bypass Secure Web Gateways, Firewalls, AV and sandbox defences.**

3 The images and documents are **forwarded by the Web Gateway** to Deep Secure.

Extract   **Verify**   **Build**
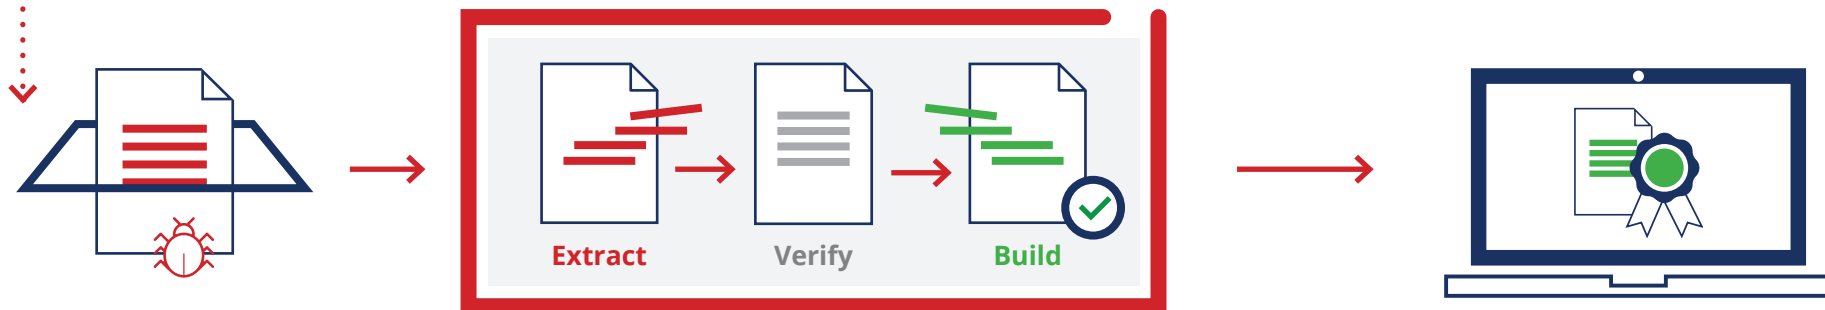

4 **Deep Secure's Threat Removal platform** receives the documents and images, **extracts** the valid business information, **verifies** it, discards the originals, **builds** wholly new files populated with the valid business information and hands them back to the Web Gateway for onward delivery.

5 The images and documents are **delivered 100% risk-free,** fully editable, in the same file format as the originals and the whole process happens in real-time. The targeted user's computer is protected.
